

5 **ABSTRACT OF THE DISCLOSURE**

 The present invention relates to a locking device for foldable rigid buckling packing housings, which has a lower housing and an upper housing hinging to each other, wherein the hinge between the upper housing and the lower housing has a structure as following: an upper housing hinge plate is attached on the upper housing; the upper housing hinge plate is
10 interconnected with the lower housing hinge plate; a locking plate is installed on the lower housing to lock the rotatable arms of the upper housing hinge plate in both clockwise and anticlockwise direction; the locking plate is linked to a button on the side wall of the lower housing; the button has a resetting spring. The present invention makes the foldable rigid buckling packing housings able to be locked in both closed position and open position, and
15 makes the structure simple and the device easy to use.
